

Islandora Module

Overview

The core Islandora module establishes a connection between the front-end Drupal website and the back-end Fedora Commons repository. Installing and enabling the Islandora module adds an Islandora Repository link to your site's Navigation menu, and an Islandora link to the Administration panel.

Dependencies

None - Islandora 7.x.1.1 can be enabled with no other required modules.

Despite requiring no modules as dependencies, without the Islandora Basic Collection module, the Islandora module will be effectively useless.

Downloads

Installation

A complete installation guide can be found at the page [Installing the Islandora Module](#).

Usage

Basic instructions for using the Islandora module can be found in [Chapter 3 - Getting Started with Islandora](#)

Configuration

Configuration options for the Islandora module can be found on your site at `http://path.to.your.site/admin/islandora/configure`, and includes the following options:

[General Configuration](#)

- The **Fedora Base URL** is the path to the Fedora webapp on your Tomcat (or other) server. On a default installation, this will be `http://localhost:8080/fedora`; if your port or path were changed during installation, these will need to be corrected to reflect that.
- The **Root Collection PID** is the Persistent Identifier fedora will use for your root collection. This may not need to be changed.

Namespaces

It may be convenient to set up namespace restrictions on your site - for example, to prevent sharing of objects across multiple sites using the same installation. Restrictions entered can use the following formats:

- Use **namespace**: to add access to all of the objects using the namespace: PID
- Use **namespace:object** to allow access to a specific object
