Moving your VIVO Instance

This page describes what you would need to do to move your VIVO instance from one machine to another.

Step-by-step guide

- 1. Make a backup of your current VIVO source directory
- 2. Make a backup of your current VIVO relational database
- 3. If different from your relational database, make a backup of your current VIVO triple store
- 4. Copy these backup files to your new machine
- 5. Create the vivo database, using the same username and password as the previous machine
- 6. Load the relational database from the backup
- 7. If you're installing everything into the same place that they were installed on the original machine, then there are no configuration changes to be
- 8. Otherwise, you'll need to modify your build.properties in the VIVO source directory, and runtime.properties in the VIVO home directory, changing any paths necessary
- 9. If your relational database and triple store information are the same as before (same graphs, same usernames, same passwords), then there are no configuration changes to be made
- 10. Otherwise, you'll need to modify your *.properties files (see above), changing any username and password information for relational and semantic stores
- 11. Make sure tomcat is NOT running prior to building and installing VIVO
- 12. Build and install VIVO
- 13. Start tomcat

And that should be it.
