

About Fedora

Fedora is middleware that is designed to integrate with other systems and services and stores, preserves, and provides access to millions of digital objects held in thousands of repositories.

Why Fedora?

- Fedora is flexible
- Fedora supports stable digital preservation
- Fedora is standards-based
- Fedora is backed by a thriving international community and long-term partnerships with research institutions

Flexible

Fedora is **flexible** middleware. As the center of your repository's architecture, Fedora connects to many front ends, including Islandora, Samvera, and custom-built. On the back-end, content can be stored on diverse storage infrastructures including cloud object stores.

Friendly

Fedora is sustained by an enthusiastic **community** that offers support for development, training, and collaboration among developers, product owners, and managers. Unparalleled **stability** is achieved from long-time partnerships with hundreds of major research institutions and backing from LYRASIS as part of the DuraSpace Community Supported Programs Division.

Forthcoming

Since 2003, Fedora has served as the foundation of thousands of repositories on every continent. The community is actively expanding Fedora's future with development of **Fedora 6** in conjunction with the Oxford Common File Layout (OCFL).

Fulfilling

Fedora's built-in services add value to the repository ecosystem. Fixity services and Memento **versioning** enable long-term **preservation** of content and metadata. Content delivery is assured with built-in linked data support and the **Fedora API**.
