GSOC10 - DSpace REST API

⚠️ **Further development**

This is the page describing GSoC 2010 project ended officially in August 2010. The REST API project is continued after official GSoC date. The new address of wiki page is located at https://wiki.duraspace.org/display/DSPACE/REST+API. Please bookmark this page as all further development will be described there. Current GSoC page stays here for historical/documentation purposes.

DSpace REST API - Bojan Suzic

Integration, testing, documentation and further development of DSpace REST services for 1.x and 2.0 versions. - Bojan Suzic

Details

Project Title:	DSpace REST API
Student:	Bojan Suzic, University of Technology Graz
Mentors:	Aaron Zeckoski, Mark Diggory
Contacting author:	*bojan.suzic* AT *gmail_DOT_com* - using subject line *DSpace*
SCM Location for Project:	http://scm.dspace.org/svn/repo/modules/rest

Project description

The REST approach promotes simplification and decoupling of software architecture, enabling further scalability, portability, granularity and simplified interaction of software systems and components.
The aim of this project is to provide DSpace with REST capable API and underlying component, which will enable developers and end-users to exploit the advantages of such approach.

Some of uses this module is intended to provide could be, for instance:

- interaction between DSpace systems and/or other repositories
- automation of different activities, e.g. submission of packages
- integrating repositories in process workflows of other applications or systems
- interaction with many kinds of systems or web applications, such as CMS, LMS, LCMS, VLS, AMS etc
- providing of other approaches to UI, such as client based/run UI
- crawling of repositories, exposing information in structural way

This project is continuation of last year's activities, supported by Google as part of GSoC 2009. In the first stage the basic support for REST for DSpace is provided, exposing many parts of DSpace functionality to the clients.

In this year's GSoC the following activities should be primarily addressed:

- integration of existing code in the system
- alignment of REST API with currently available DSpace features/functionality, e.g. adding of new features
- extending of existing code, in order to provide better handling of management and injection functions
- providing more detailed documentation and examples for end users
- testing activities, e.g. cooperation/coordination with other GSoC 10 project Unit testing
- promotion of DSpace REST interaction (by taking part in integration with other systems)

Detailed activities

In the following sections main activities are elaborated in detail.

REST API Endpoints

In the following section listed are supported endpoints on the application level. **The items marked with dot (in C column) are in phase of implementation, while other items are considered already working.**

Please note that additional tests should be made in order to ensure proper stability of the whole application.

The sorting of the fields / output results is currently partially supported. This part of the application is implemented independently of the endpoints and will be worked on after the most of endpoints are completed.

> ⚠ **Naming convention for endpoints**
>
> DSpace 1.x and 2.x are treating the resources on different way. 2.x is more generalized, suggesting the use of RDF-like interrelation notations.

Repository browsing

Earlier Implementation Description - GSoC09

C	Verb	URL	Description	Mandatory parameters	Optional parameters	Sorting fields	Response Data	Formats	Response codes
	GET	/communities	Returns a list of all communities on the system or return just top level communities.	-	DSPACE:topLevelOnly=true DSPACE:idOnly=false	DSPACE:id DSPACE:name DSPACE:countitems	The list of communities containing DSPACE:respective fields . Response code details: 204 - if there are no communities on the system	json xml	DSPACE:200, 204, 400, 500
	GET	/communities/{id}	Return detailed information about id community.	id	idOnly=false	-	DSPACE:Fields describing community.	json xml	DSPACE:200, 400, 404, 500
	GET	/communities/{id}/{element}	Return a particular data field found in the community id Fields supported (for element): id - entity identifier, internal to the system name - entity name countItems - number of items under community handle - handle of the community (unique persistent resource identifier) type - entity type (object type in the system) collections - collections contained in the community, ordered by id canedit - states user persmission on the community (editing) anchestor - anchestors of the community children - subcommunities, ordered by id administrators - group administrators, ordered by id recent - recent items in the community shortDescription - short description copyrightText - copyright text sidebarText - sidebar text introductoryText - introductory text	id	DSPACE:idOnly=false DSPACE:immediateOnly=true	DSPACE:id DSPACE:name DSPACE:countitems	Respective field info	json xml	DSPACE:200, 204, 400, 500
	GET	/communities/{id}/logo	Return a community logo	id	-	-	Contains community logo (bitstream)	binary	DSPACE:200, 400
	GET	/collections	Return a list of all collections in the system.	-	DSPACE:idOnly=false DSPACE:isAuthorized=false	DSPACE:id DSPACE:name DSPACE:countitems	The list of the collections containing DSPACE:respective fields. Response code details: 204 - if there are no communities on the system	json xml	DSPACE:200, 204, 400, 500

	GET	`/collections/` `{id}`	Return detailed information about `id` collection	`id`	DSPACE: idOnly=false	DSPACE:id DSPACE: name DSPACE: countitems	DSPACE:Fields of the collection entity.	`json` `xml`	DSPACE:200, 204, 400, 500
	GET	`/collections/` `{id}/{element}`	Return a particular data field found in the collection `id`. Fields supported (for `element`): `id` - entity identifier, internal to the system `name` - collection name `licence` - collection licence `items` - items contained in collection `handle` - handle of the collection (unique persistent resource identifier) `canedit` - states user permission on the collection (edit) `communities` - communities collection is a part of `countItems` - number of the items in the collection `type` - entity type (object type in the system) `shortDescription` - short description of the collection `introText` - introductory text for the collection `copyrightText` - copyright text for the collection `sidebarText` - sidebar text for the collection `provenance` - provenance	`id`	DSPACE: idOnly=false DSPACE: immediateOnly= true	DSPACE:id DSPACE: name DSPACE: countitems	Respective field info	`json` `xml`	DSPACE:200, 204, 400, 500
	GET	`/items`	Return a list of the items in the system	-	-	-	The list of the items containing DSPACE:related fields . Response code details: `204` - if there are no communities on the system		

	GET	`/items/{id}`	Return detailed information about an item.	`id`	-	`id`
						`name`
						`lastmodif`
						`ied`
						`submitter`
							DSPACE:Fields of the item entity.	`json`
								`xml`
									200, 204, 400, 500

	GET	`/items/{id}/` `{element}`	Return a particular data field foud in the item `id` Fields supported (for `element`): `metadata` - item metadata `submitter` - submitter group `isArchived` - archival status of the item `isWithdrawn` - states if the item is withdrawn `owningCollection` - owning collection of the item `lastModified` - last modified time `collections` - collections the item appears in `communities` - communities the item appears is `name` - name of the item `bitstreams` - bitstreams related to the item `handle` - item handle (unique identified) `canedit` - states can user edit the item `id` - item id `type` - element type `bundles` - bundles related to the item	`id, element`	-	-	Respective field info	`json` `xml`	200, 204, 400, 500
	GET	`/bitstream/{id}`	Return bitstream object - usually the library item file.	`id`	-	-	DSPACE:Fields of the bitstream entity.	`json, xml`	200, 400, 401, 403, 404, 500
	GET	`/bitstream/{id}` `/{element`	Return a particular data field found in bitstream `id`. Supported fields (for `element`): `mimeType` - mime type of file `bundles` - bundles the bitstream is a part of `checkSum` - checksum of the file `checkSumAlgorithm` - checksum algorithm used `description` - bitstream description `formatDescription` - file format description `sequenceId` - sequence id of the file `size` - size of the file `source` - source (typically filename with path information) `storeNumber` - asset store number where the bitstream is stored `userFormatDescription` - user's format description `name` - bitstream name `handle` - unique id of the bitstream `id` - internal id of the bitstream `type` - type of the entity (referring to bitstream)	`id, element`	-	-	Respective field info	`json, xml`	200, 400, 401, 403, 404, 500
	GET	`/bitstream/{id}` `/receive`	Return bitstream	`id`	-	-	Return bitstream	`binary`	200, 400, 401, 403, 404, 500
	GET	`/groups`	Return a list of the groups in the system	-	-	-	The list of the groups containing related DSPACE:fields . `204` if there are no groups in the system.	`json,xml`	200, 204, 400, 500
	GET	`/groups/{id}`	Return a group object	`id`	-	-	DSPACE:Fields of the group entity.	`json,xml`	200, 204, 400, 500

	GET	/groups/{id}/{element}	Return a particular data field found in the group entity id. Supported fields (for element): handle - unique id (external) id - internal id of the gruop isEmpty - is the group empty members - group members (as users) memberGroups - group members (as groups) name - group name type - entity type (referring to group)	id, element	-	-	Respective field info	json,xml	200, 204, 400, 500
	GET	/users	Return a list of the users in the system	-	-	-	The list of the users containing related DSPACE:fields .	json,xml	200,204,400,500
	GET	/users/{id}	Return a user info	id	-	-	DSPACE:Fields of the user entity.	json,xml	200,204,400,500
	GET	/users/{id}/{element}	Return a particular data field found in the user id. Supported fields (for element): email - user's email firstName - first name fullName - full name handle - handle (unique, external) id - internal id of the user language - preferred language lastName - last name name - name netId - network id requireCertificate - requires certificate to login selfRegistered - is user self registered type - type of the object	id,element	-	-	Respective field info	json,xml	200,204,400,500

Note: modifier `idOnly` is referred only to first layer of the results. For all other layers (e.g. nested results) only ids are returned in some cases, due to possible loops. Example: for community containing collections, on second level the response contains only ids for some elements where multiple loops may be created (community->has_collection->has_community....). Other data is modified according to `idOnly` flag.

Optional parameters

Parameter	Description
topLevelOnly	returns only top level communities
idOnly	if true return only the identifiers for the record
immediateOnly	return only direct parent community
isAuthorized	return only collections user has permission to work on
inArchive	return archived items for respective collection

Sorting fields:

> ⓘ **Not completed!**
>
> The sorting of the fields / output results is currently partially supported. This part of the application is implemented independently of the endpoints and will be worked on after the most of endpoints are completed.

Parameter	Description	Ordering supported
id	sort results by entity id	asc | ascending desc | descending
name	sort results by entity name	asc | ascending desc | descending
countitems	sort results by number of items contained	asc | ascending desc | descending
lastmodified	sort results by date of last item modification	asc | ascending desc | descending
submitterName	sort results by submitter name	asc | ascending desc | descending

submitterId	sort results by submitter id	asc | ascending desc | descending

Controlling results

Parameter	Description	Default	Example
_start	position of the first entity to return	0 (first)	_start=5 to list 6th item and onwards
_page	page of data to display	0 (first)	_page=2, to display second page with query results
_perpage	number of results to show on each page	0 (all)	_perpage=10 to display 10 results per page
_limit	maximum number of entities to return	0 (all)	_limit=50
_sort		the sort order to return entities in should be comma separated list of field names suffix determines ordering suffixes: _asc, _ascending, _desc, _descending ascending default	sort=name _sort=name,email_desc,lastname_desc

Response codes

Code	Description
200	OK
201	Created
204	No content
400	Bad request
401	Unauthorized
403	Forbidden
404	Not found
405	Method not allowed
500	Internal server error
503	Service unavailable

Authentication/Authorization

Currently only standard authentication is supported. The authentication data is provided in the request or header body.

Example:

`/rest/communities.json?user=user@email.com&pass=userpassword`

The same elements `user` and `pass` are used for header based authentication.

Authorization is done on underlying api level; in the case of error the proper message and error code are returned to the user.

Repository manipulation

C	Verb	URL	Description	Mandatory parameters	Optional parameters	Response Data	Formats	Response codes
	POST	/communities	Action to be done under community id, adding new content or values. Supported actions: createAdministrators createCollection createSubcommunity	id, action - name name	-	Id of newly created entity, depending on the action selected: id of group of administrators id of collection id of subcommunity	json xml	200, 400, 401, 403, 500

C	Verb	URL	Description	Mandatory parameters		Response Data	Formats	Response codes

	PUT	/communities/{id}/{element}	Update the field `element` of the community `id`.
			
			Supported fields:
			`name` - change name
			`shortDescription` - change short description
			`copyrightText` - change copyright text
			`sidebarText` - change sidebar text
			`introductoryText` - change introductory text
			`collections` - add existing collection
			`children` - add existing subcommunity
				`id`
				
				`value`
				`value`
				`value`
				`value`
				`value`
				`cid`
				`cid`
					-	Response code		200, 400, 401, 403, 500

	PUT	/communities/{id}/logo	Set the logo for community `id`	`id`	-	Response code	binary	200, 400, 401, 403, 500
•	DELETE	/communities/{id}	Delete community from the system	`id`	-	Response code	json xml	200, 400, 401, 403, 500

•	DELETE	/communities/{id}/{element}/{eid}	Remove attribute/value `eid` of element `element` from the community `id`.
			
			Suported elements:
			`collections`
			`children`
			`administrators`
				`id, eid`
				
				`cid`
				`cid`
				-
					-	Response code	json
							xml	

	POST	/collections	Action to be done under collection `id`, adding new content or values.
			
			Supported actions:
			`createAdministrators`
			`createSubmitters`
			`createTemplateItem`
			`createWorkflowGroup`
				`id, action`
				
				-
				-
				-
				`step`
					-	Id ow newly created element	json
							xml
								200, 400, 401, 403, 500

	PUT	/collections/{id}/{element}	Update field `element` of the collection `id`.
			
			Supported elements:
			`shortDescription` - short description
			`introText` - introductory text
			`copyrightText` - copyright text
			`sidebarText` - sidebar text
			`provenance` - provenance
			`licence` - collection licence
			`name` - collection name
				`id`
				
				`value`
				`value`
				`value`
				`value`
				`value`
				`value`
				`value`
					-	Response code	json
							xml
								200, 400, 401, 403, 500

•	DELETE	/collections/{id}	Delete collection from the system	-	-	Response code	json xml	200, 400, 401, 403, 500

•	DELETE	/collections/{id}/{element}/{cid}	Remove attribute/value `cid` from collection `id`
			Supported attributes:
			`administrators`
			`item`
			`submitters`
			`templateItem`
				`id, cid`	-	Response code	json
							xml
								200,400,401,403,500

•	PUT	/collections/{id}/logo	Set the logo for collection `id`	`id`		Response code	binary	200,400,401,403,500

•	POST	/items	Action to be done under item `id`, adding content or value.
			
			Supported actions:
			`createBundle`
			`createBitstream`
				`id, action`
				
				`name`
				`name, input`
						Id of newly created element	json,xml, binary	200,400,401,403,500

•	PUT	/items/{id}/{element}	Update field `element` of the item `id`
			
			Supported fields:
			`isArchived`
			`isWithdrawn`
			`owningCollection`
			`submitter`
				`id,element`	-	Response code	json,xml	200,400,401,403,500

•	DELETE	/items/{id}	Delete item from the system	`id`	-	Response code	json,xml	200,400,401,403,500

•	DELETE	/items/{id}/{element}/{eid}	Delete element/attribute `eid` from the item `id`
			
			Supported fields for `element`:
			`bundle`
			`licences`
				`id,element,eid`	-	Response code	json,xml	200,400,401,403,500

Content searching

C	Verb	URL	Description	Mandatory parameters	Optional parameters	Sorting fields	Response Data	Formats	Response codes

	GET	/search	Return a list of all objects found by searching criteria.
			Notice: community and collection are mutually exclusive options.
				-	modifiers{{query=`query`}}&
					(community=`id` or collection={{`id`}}
					idOnly=false
						`id`
						`name`
						`lastmodified`
						`submitter`
							Item info with basic metadata for the search results. Additionally return only identifiers when `idOnly=true` is used.	json
								xml
									200, 204, 400, 500

	GET	/harvest	Return a list of all objects that have been created, modified or withdrawn within specified time range.	-	`startdate`
					{enddate}}
					`community`
					`collection`
					`idOnly=false`
					`withdrawn=false`
					Notice: community and collection are mutually exclusive options
						-	Contains item info including id, name, handle, metadata, bitstreams according to the defined requirements. Additionally when idOnly=true only identifiers of results are returned. If the date is in incompatible format, error 400 is returned.	json
								xml
									200, 204, 400, 500

Statistical info

C	Verb	URL	Description	Mandatory parameters	Optional parameters	Sorting fields	Response Data	Formats	Response codes
	`GET`	`/stats`	Return general statistics.	-	-	-	Cummulative list of statistics data for the system currently available.	`json` `xml`	200, 400, 500

Relationships interface

> ⓘ **Experimental feature**
>
> This is considered as a experimental feature in the phase of being considered for compability with future versions of DSpace. Consider not important section; the status of the feature for upcoming release yet to be determined.

C	Verb	URL	Description	Mandatory parameters	Optional parameters	Sorting fields	Response Data	Formats	Response codes
•	GET	/resource/ {handle} /relations	Return entities according to relation and parameters specified	`handle` DSPACE: `property`	DSPACE:rtype rfield	-	ontains entities selected and sorted in conformance to request parameters. For more details see description of `rtype` and`rfield`.	`json` `xml`	DSPACE:200, 204, 400, 401, 403, 500

Mandatory parameters

Parameter	Description	Values	Example
`property`	Return entities satisfying requested property relation	**Structural properties** `ds:isPartOfSite` `ds:isPartOfCommunity` `ds:isPartOfCollection` `ds:isPartOfItem` `ds:isPartOfBundle` `ds:hasCommunity` `ds:hasCollection` `ds:hasItem` `ds:hasBundle` `ds:hasBitstream` `ds:hasBitstreamFormat` **Communities and collections** `ds:logo` **Bistream format** `ds:support` `ds:fileExtension` `ds:mimeType` **Bitstream** `ds:messageDigest` `ds:messageDigestAlgorithm` `ds:messageDigestOriginator` `ds:size` **Eperson** `ds:language`	`property=ds:hasCommunity` - return subcommunities of a community `property=ds:isPartOfCommunity` - return communities current community is part of (children) `property=ds:hasCollection` - return collections belonging to community `property=ds:hasItem` - return Items belonging to community
`rtype`	restriction on type - only entity with specifed type(s) would be returned	`ds:Bitstream` `ds:Bundle` `ds:Collection` `ds:Community` `ds:EPerson` `ds:Group` `ds:Item` `ds:DSpaceObject` `ds:Policy` `ds:Site` `ds:BitstreamFormat`|	`rtype=ds:Collection` - return entities of Collection type
`rfield`	restriction on fields - return only selected fields; by default all fields are returned	id name countitems metadata subcommunities ancestors owner other (depending on object type, will be documented later)	rfield=id,name - return only entity id and name in response

Note: incomplete/orientative properties, for more info check [Vocabularies|http://code.google.com/p/dspace-sandbox/source/browse/#svn/modules/dspace-rdf/tags/dspace-rdf-1.5.1/src/main/java/org/dspace/adapters/rdf/vocabularies].

Visitors' suggestions or wishes

Here the visitors and stakeholders can insert their suggestions or describe the needs for their applications in detail.

Comment: In this case it is not clear how to treat `recent` part of endpoint. If we stick to semantic mapping, then it should look like `/resource/id /mapping`, but `recent` in this case obviously do not represent a mapping, but the property.

Comment #2: Semantic mapping presented in this case should be probably hardcoded for 1.x branch, but on abstraction level which enables easy replacement with some auto-discovery method prepared for 2.x and eventually backported to 1.x. This way we would be able to call something similar to `/c ommunities/id` or `communities/id/capabilities` in order to get supported mappings (amongst other data).

Suggesting new options:

Instead of changing wiki contents visitors can enter their suggestions as a comments.

1) **Kevin S. Clarke and Tim Donhue** suggested adding of the new feature related to HTTP Basic Auth. Ok, I will investigate how it could be done and included here. More info comming.

Integration in the system

It is planned to consult two external subjects for cooperation and the assistance during integration process (LMS and national library internal automation process). More information coming soon - awaiting approval of other parties.

Documentation tasks

Although provided software module exposes basic documentation automatically to the end user, in order to make it easier for other developers and users the documentation in the following forms is additionaly to be provided:

- Confluence pages, current location
- integrated documentation in PDF form (manual)
- short slides containing technology overview, advocacy/facts, configuration and usage guideliens and examples
- code will be additionally commented

Example of usage

At the end of the current stage of this project as a bonus task (if time constraints allow) the examples of usage will be provided for several languages, the use-cases will be presented (example of integration in other software, e.g. LMS) and optionally simple client system demonstrating UI customization will be demonstrated (e.g. Flex or JavaFX like).

Information for developers

In this section the main sections of the software will be briefly explained in order to ease update or extension of the components.

The REST API for DSpace uses Aaron Zeckoski's EntityBus and DSpace standard libraries, as dspace-api.

There are two main packages: **org.dspace.rest.providers** and **org.dspace.rest.entities**. Providers are responsible for serving content/feeds to the users. They usually prepare entities or particular entity and/or handle update/delete/create functions. The main class there is **AbstractBaseProvider**, which is extended by other providers.

In the providers, at the constructor level created are mappings between particular endpoints (e.g. /rest/items/1/collections) and related functions in entities (org.dspace.entities.items.getCollections). Thus, for each GET, PUT, POST or DELETE function in the entity provider's constructor defined are such mappings between URL endpoints and functions. After the client makes specific call, the provider prepares answer and in this phase calls mapped function and prepare results for display.

So, if you want to extend currently available endpoints for already present providers and entities, it is necessary to define mapping at provider level and prepare corresponding function at the entity level (based on the template). The system then calls this function and provides necessary arguments for its successfully handling.

If you want to develop a new provider, it is usually necessary to create new provider class in org.dspace.rest.providers and then create related entity in org.dspace.rest.entities. The currently available providers are good example how to do that.
