## Portable citations (discontinued)

- Student: Jodi Schneider
- Mentor: [Stuart Lewis](#)
- Mentor Backup: Claudia Jürgen
- Mentor Backup: Christophe Dupriez

## Design Requirements (What should the program do?)

Portable citations provides utilities for metadata import and export. Anyone should be able to export the metadata in DSpace to bibliographic software. Administrators need to be able to import citations from bibliographic software and internal databases. What bibliographic formats and software should be supported?

## Export

### Capture/export from various DSpace modes

- list level
  - browse
  - search
- individual record level
  - short item record
  - long item record

### Formats/programs to export into

#### Essential

- BibTeX (Example BiB file: [xapl.bib](#)) (Style examples ([output](#)))
  - brief BibTeX style
  - full BibTeX style
- [Endnote](#) formats
- RIS (Used by [Refworks](#), [ProCite](#))

#### Additional formats for export, if possible

- Formats it would be nice to support. Not essential at the start.
  - APA ([LIU example](#)) ([OWL details](#))
  - MLA ([LIU example](#)), ([OWL details](#))
  - [Zotero](#) formats ("Zotero is a free, easy-to-use Firefox extension to help you collect, manage, and cite your research sources.")

#### Further additional formats that could be supported

- Chicago ([LIU example](#))

- Turabian ([LIU example](#))
- Others? (CBE, AMA,...) Purdue's OWL has a [discipline-based list](#). DCMI [discipline-based list](#). DCMI [standards](#).

## Import

The import utility should accept certain formats by default. It must also allow configuration at the repository level, to add import formats and to change the crosswalk assumed.

### Included "out of the box"

- BibTeX ([Example BibTeX file](#))
  - brief BibTeX format
  - full BibTeX format
- Dublin Core XML
- Endnote
- RIS
- Various publishers' formats
  - specifically mentioned to me: PsycInfo, Agricola, ERIC, Encyclopedia Britannica

### Configurable

Configuration may be necessary to import file formats aside from the expected ones. Configuration may also be necessary on the entire suite if a local instance uses an extended or modified metadata scheme.

- Configurable to add import file formats
  - For example, retrieve metadata from faculty website (publications section)
- Configurable to "crosswalk" from one format to another.
  - For example, a repository manager may wish to transform citations from RIS format into the DC scheme used in a local instance of DSpace. S/he would like to modify the crosswalk by filling in the "source" and "target" fields on a grid, like this:

Source Format	Target Format
AI	=> contributor.author
TI	=> citation.atitle
JF	=> citation.jtitle
VL	=> citation.volume
AB	=> description.abstract
etc.	

### Dependencies

Various schemes, file formats, and scripts are used for bulk import into DSpace instances. Are there any common features and needs? Ideally, Portable Citations will be usable in all circumstances. Are there particular features of the program that will facilitate this flexibility? Portable Citations will need to be tested against each of the most common import methods.
