

Fedora-Commons -Database

I am trying to setup Fedora commons and also trying to understand how it works.

1. I have mySql Database, when i create new objects, i can see the new record in doFields and doRegistry tables, but when i add new datastream i cant see any changes/inserts in any of my fedora database. I am wondering where are we storing those values. I can see those in xml file but still i cant see where we are storing those ml files/datastream values.

2. I need to import data from couple of other databases, do i have to create xml of old database and import in new database ? looks pretty lengthy process, specially to format old data in required xml format.

Is there any other way i can do it ?

Thanks

Ron
