- [Examples](#)
 - [SELECT to JSON example](#)
 - [DESCRIBE to N3 example](#)
- [Enabling the SPARQL Query API](#)

Purpose

Permits external applications to obtain data from the VIVO data model.

The results of the queries are not filtered, so access to the service should remain restricted if the VIVO instance contains any data which should remain private. Queries can be performed against the entire data model, or against specific graphs. .

By default, the SPARQL Query API is disabled in VIVO, for security reasons. See [Enabling the API](#)

Use Cases

Reusing data from VIVO

Data in VIVO is available to other applications via [Linked Open Data - requests and responses](#). But some applications may work better with the sort of data sets that can be obtained from SPARQL queries.

Writing a VIVO "face" application

Various VIVO sites have written applications, in Drupal or other such frameworks, that display data from VIVO, and allow the user to edit their data. This API, used in conjunction with [SPARQL Update API](#), allows such an application to freely read or modify VIVO data.

Specification

URL

[vivo]/api/sparqlQuery

Examples:

```
http://vivo.cornell.edu/api/sparqlQuery
```

```
http://localhost:8080/vivo/api/sparqlQuery
```

HTTP Method

The API supports HTTP GET or POST calls.

Parameters

name	value
email	the email address of a VIVO administrator account
password	the password of the VIVO administrator account
query	A SPARQL query

The syntax of the SPARQL query is described on the World Wide Web Consortium site at <http://www.w3.org/TR/2013/REC-sparql11-query-20130321/>

Response Codes

Code	Reason
200 OK	SPARQL query was successful.
400 Bad Request	HTTP request did not include a <code>query</code> parameter.
	The SPARQL query was syntactically incorrect.
	The type of the SPARQL query was not <code>SELECT</code> , <code>ASK</code> , <code>CONSTRUCT</code> , or <code>DESCRIBE</code>
403 Forbidden	HTTP request did not include an <code>email</code> parameter.
	HTTP request did not include a <code>password</code> parameter.
	The combination of <code>email</code> and <code>password</code> is not valid.
	The selected VIVO account is not authorized to use the SPARQL Query API.
406 Not Acceptable	The <code>Accept</code> header does not include any available content types.
500 Internal Server Error	VIVO could not execute the request; internal code threw an exception.

Available content types

The request may include an `Accept` header, to specify the preferred content type of the response. If no `Accept` header is provided, the preferred content type is assumed to be `text/plain`.

For `SELECT` or `ASK` queries

`SELECT` queries return rows of results, and each row may include an arbitrary number of values, depending on the query.

`ASK` queries return a single result, which is either `true` or `false`.

MIME type in the <code>Accept</code> header	Response format	Format description
<code>text/plain</code>	<code>text</code>	
<code>text/csv</code>	<code>CSV</code>	http://www.w3.org/TR/2013/REC-sparql11-results-csv-tsv-20130321
<code>text/tab-separated-values</code>	<code>TSV</code>	
<code>application/sparql-results+xml</code>	<code>XML</code>	http://www.w3.org/TR/2013/REC-rdf-sparql-XMLres-20130321
<code>application/sparql-results+json</code>	<code>JSON</code>	http://www.w3.org/TR/2013/REC-sparql11-results-json-20130321

For `CONSTRUCT` or `DESCRIBE` queries

`CONSTRUCT` and `DESCRIBE` queries return RDF.

MIME type in the <code>Accept</code> header	Response format	Format description
<code>text/plain</code>	<code>N-Triples</code>	http://www.w3.org/2001/sw/RDFCore/ntriples/
<code>application/rdf+xml</code>	<code>RDF/XML</code>	http://www.w3.org/TR/rdf-syntax-grammar/
<code>text/n3</code>	<code>N3</code>	http://www.w3.org/TeamSubmission/n3/
<code>text/turtle</code>	<code>Turtle</code>	http://www.w3.org/TeamSubmission/turtle/

application/json	JSON-LD	http://www.w3.org/TR/json-ld/
------------------	---------	---

Limitation

Queries can be performed against specific graphs. However, the graphs that hold application data are not accessible to the API. "Application data" means data that controls the functioning of the VIVO application, such as user accounts, page definitions, or display parameters.

Examples

These examples use the UNIX `curl` command to issue queries to the API.

SELECT to JSON example

This example reads 5 arbitrary triples from the data model, returning the result as JSON.

```
curl -i -d 'email=testAdmin@mydomain.edu' -d 'password=Password' -d 'query=SELECT ?s ?p ?o WHERE {?s ?p ?o}
LIMIT 5' -H 'Accept: application/sparql-results+json' 'http://localhost:8080/vivo/api/sparqlQuery'
```

The response looks like this:

```
{
  "head": {
    "vars": [ "s" , "p" , "o" ]
  } ,
  "results": {
    "bindings": [
      {
        "s": { "type": "bnode" , "value": "b0" } ,
        "p": { "type": "uri" , "value": "http://www.w3.org/1999/02/22-rdf-syntax-ns#rest" } ,
        "o": { "type": "bnode" , "value": "b1" }
      } ,
      {
        "s": { "type": "bnode" , "value": "b0" } ,
        "p": { "type": "uri" , "value": "http://www.w3.org/1999/02/22-rdf-syntax-ns#first" } ,
        "o": { "type": "uri" , "value": "http://purl.obolibrary.org/obo/ERO_0000006" }
      } ,
      {
        "s": { "type": "bnode" , "value": "b2" } ,
        "p": { "type": "uri" , "value": "http://www.w3.org/1999/02/22-rdf-syntax-ns#rest" } ,
        "o": { "type": "uri" , "value": "http://www.w3.org/1999/02/22-rdf-syntax-ns#nil" }
      } ,
      {
        "s": { "type": "bnode" , "value": "b2" } ,
        "p": { "type": "uri" , "value": "http://www.w3.org/1999/02/22-rdf-syntax-ns#first" } ,
        "o": { "type": "bnode" , "value": "b3" }
      } ,
      {
        "s": { "type": "uri" , "value": "http://vivoweb.org/ontology/core#FacultyMember" } ,
        "p": { "type": "uri" , "value": "http://vitro.mannlib.cornell.edu/ns/vitro/0.
7#hiddenFromDisplayBelowRoleLevelAnnot" } ,
        "o": { "type": "uri" , "value": "http://vitro.mannlib.cornell.edu/ns/vitro/role#public" }
      }
    ]
  }
}
```

DESCRIBE to N3 example

This example reads all of the properties for a particular individual in the model, returning the result as N3.

```
curl -i -d 'email=vivo_root@mydomain.edu' -d 'password=Password' -d 'query=DESCRIBE <http://dbpedia.org/resource/
Connecticut>' -H 'Accept: text/n3' 'http://localhost:8080/vivo/api/sparqlQuery'
```

The response looks like this:

```
@prefix vitro:    <http://vitro.mannlib.cornell.edu/ns/vitro/0.7#> .
@prefix owl:    <http://www.w3.org/2002/07/owl#> .

Enabling the SPARQL Query API

Before enabling the SPARQL Query API, you should secure the URL `api/sparqlQuery` with HTTPS. Otherwise, email/password combinations will be sent across the network without encryption. Methods for securing the URL will depend on your site's configuration.

By default, the SPARQL Query API is disabled in VIVO for all users except the root user. To enable it for non-root users, you must edit the RDF file `[vivo]/home/rdf/auth/everytime/permission_config.n3` to authorize your site administrators to use the API. Find the permissions for `auth:ADMIN` and include the following permission:

permission_config.n3

```
auth:hasPermission simplePermission:UseSparqlQueryApi;
```

After editing this file you need to restart tomcat.
