

Installing Fedora

Fedora, along with Drupal, is one of the core technologies behind Islandora. This chapter will cover the basic steps for installing Fedora - for more information, please see the [FedoraCommons documentation](#).

Fedora is available under the terms of the [Apache License](#) and has a very active open source community producing additional tools, applications and utilities. Islandora currently uses Fedora version 3.4.2.

Pre-installation software checklist

Fedora requires the following to be set-up and running prior to beginning your installation:

- [Java SE Development Kit \(JDK\) 6](#)
- A database: Installed for Drupal. Consult the Fedora installation guide for notes on running other databases.
- An application server: Fedora includes the Tomcat Application Server. Consult the Fedora installation guide for notes on running other application servers.

Installation Steps

1. [Download](#) the Fedora Repository software.

2. Read through the online guide to ensure the pre-installation system pre-requisites are met.

3. Preparing your local environment variables by modifying the `.bash_profile` or `.profile` file in the home directory of the fedora user. The following example assumes Java is installed in `/opt/java` and Fedora is installed in `/usr/local/fedora`:

```
PATH=/opt/java/bin:$PATH:$HOME/bin
export FEDORA_HOME=/usr/local/fedora
export CATALINA_HOME=/usr/local/fedora/tomcat
export JAVA_OPTS="-Xms1024m -Xmx1024m -XX:MaxPermSize=128m -Djavax.net.ssl.trustStore=/usr/local/fedora/server/truststore
-Djavax.net.ssl.trustStorePassword=tomcat"
export JAVA_HOME=/opt/java
```

4. Before beginning your Fedora installation, create a database for Fedora to use (In the `install.properties` file example that follows the database is called `fedora3`. This is referenced as part of the value string for `database.jdbcURL`).

5. To start the installer, navigate to the directory where the install file was downloaded and run the following a command:

```
java -jar fcrepo-installer-3.4.2.jar
```

6. Select the CUSTOM INSTALL.

Note: It is important to select the Custom Install as it will enable the resource index by default, which is the backbone of Islandora's collection views and other functionality.

7. The Fedora installer script will ask you a series of questions (Source: [Installation and Configuration Guide - Fedora 3.4 Documentation](#)):

Servlet Container

The installer will automatically configure and deploy to Tomcat 5.0.x, 5.5.x, and 6.0.x servlet containers. However, if an existing Tomcat installation (as opposed to the Tomcat bundled with the installer) was selected, the installer will not overwrite your existing `server.xml`, but rather, place a modified copy at `FEDORA_HOME/install` so that you may review it before installing it yourself.

Other servlet containers will require manual deployment of the `war` files located at `FEDORA_HOME/install`.

Application Server Context

The installer provides the option to enter an application server context name under which Fedora will be deployed. The context name defaults to `Fedora` (resulting in `http[s]://host:port/fedora`), however any other valid context name can be supplied. The installer will name the resulting `war` file according to the supplied context name (defaults to `fedora.war`). Please ensure that the servlet container configuration reflects the name of the Fedora context name in case it needs to be configured explicitly. For further details see [Alternative Webapp Context Configuration](#).

SSL

Configuring SSL support for Fedora's API-M interface is an optional feature. It is strongly recommended for production environments if Fedora is exposed to unsecured applications and users. However, if your installation is within a managed data center with firewall services, you may choose to provide SSL using a software or hardware front-end instead. For example, a reverse proxy implemented using the [Apache HTTP Server](#) and hiding Fedora generally provides better SSL performance.

If the Tomcat servlet container is selected, the installer will configure `server.xml` for you. However, as noted above, if an existing Tomcat installation was selected, the installer will not overwrite your existing `server.xml`.

Please consult your servlet container's documentation for certificate generation and installation. (In particular, the example certificate provided by the installer for Tomcat should not be used in a production environment).

If Fedora is configured to use SSL, the JAVA_OPTS environment variable must include the javax.net.ssl.trustStore and javax.net.ssl.trustStorePassword properties. The value of javax.net.ssl.trustStore should be the location of the truststore file and the value of javax.net.ssl.trustStorePassword is the password for the keystore. The following values may be used with the sample keystore included with the installer:

```
-Djavax.net.ssl.trustStore=$FEDORA_HOME/server/truststore -Djavax.net.ssl.trustStorePassword=tomcat
```

FeSL

The [Fedora Security Layer](#) is an experimental feature introduced from Fedora 3.3. FeSL Authentication is now the default authentication mechanism, however FeSL Authorization is still considered experimental. Enabling FeSL Authorization will disable the legacy policy enforcement. See [FeSL Installation](#) for more information about FeSL requirements that must be satisfied prior to installation.

Resource Index

If the [Resource Index](#) is enabled, Fedora will use [Mulgara](#) as its underlying triplestore, with full-text indexing disabled.

Messaging

If [Messaging](#) is enabled, Fedora will create and send a message via JMS whenever an API-M method is called.

Once the script has collected your answers and configured Fedora on your system, the values are written to the install.properties file located in \$FEDORA_HOME/install.

An output of a sample install.properties file is included here to guide you through the installation. To use this file, copy the full contents of the textbox below into a text editor, change the database name, database user, database password and database port number to match your database configuration, and save the edited file as install.properties to the same directory where the fcrepo jar is stored. Fedora can now be installed by entering `sudo java -jar fcrepo-installer-3.4.2.jar install.properties`

An example of an install.properties file:

```
#Install Options
#Wed Mar02 15:58:59 AST2011
keystore.file=included
ri.enabled=true
messaging.enabled=true
apia.auth.required=false
database.jdbcDriverClass=com.mysql.jdbc.Driver
tomcat.ssl.port=8443
ssl.available=true
database.jdbcURL=jdbc:mysql://localhost:8889/fedora_database_name?useUnicode\=true&characterEncoding\=UTF-8&autoReconnect\=true
messaging.uri=vm:(broker:(tcp://localhost:61616))
database.password=fedora_db_password
database.mysql.driver=included
database.username=fedora_db_user
fesl.authz.enabled=false
tomcat.shutdown.port=8005
deploy.local.services=true
xacml.enabled=true
database.mysql.jdbcDriverClass=com.mysql.jdbc.Driver
tomcat.http.port=8080
fedora.serverHost=localhost
database=mysql
database.driver=included
fedora.serverContext=fedora
llstore.type=akubra-fs
tomcat.home=/usr/local/fedora/tomcat
fesl.authn.enabled=false
database.mysql.jdbcURL=jdbc:mysql://localhost:8889/fedora_database_name?useUnicode\=true&characterEncoding\=UTF-8&autoReconnect\=true
fedora.home=/usr/local/fedora
install.type=custom
servlet.engine=included
apim.ssl.required=false
fedora.admin.pass=fedoraAdmin
apia.ssl.required=false
```

8. Once the installation script has completed and Fedora is installed, you should start your Fedora instance by running:

```
$FEDORA_HOME/tomcat/bin/startup.sh
```

9. To verify that Fedora has successfully started:

- \$FEDORA_HOME/tomcat/logs/catalina.out should contain no errors.
- View your Fedora instance through a web browser: <http://localhost:8080/fedora/>

10. Stop your Fedora instance by running: `$FEDORA_HOME/tomcat/bin/shutdown.sh` 11. Navigate to `$FEDORA_HOME/data/fedora-xacml-policies/repository-policies/default` and create a file with the following xml -

```
<?xml version="1.0" encoding="UTF-8"?>
<Policy xmlns="urn:oasis:names:tc:xacml:1.0:policy"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  PolicyId="permit-apim-to-authenticated"
  RuleCombiningAlgId="urn:oasis:names:tc:xacml:1.0:rule-combining-algorithm:first-applicable">
  <Description>note that other policies may provide exceptions to this broad policy. This policy assumes api-m
  users have to be authenticated</Description>
  <Target>
    <Subjects>
      <AnySubject/>
    </Subjects>
    <Resources>
      <AnyResource/>
    </Resources>
    <Actions>
      <Action>
        <ActionMatch MatchId="urn:oasis:names:tc:xacml:1.0:function:string-equal">
          <AttributeValue DataType="http://www.w3.org/2001/XMLSchema#string">urn:fedora:names:fedora:2.1:action:
api-m</AttributeValue>
          <ActionAttributeDesignator DataType="http://www.w3.org/2001/XMLSchema#string"
            AttributeId="urn:fedora:names:fedora:2.1:action:api"/>
        </ActionMatch>
      </Action>
    </Actions>
  </Target>
  <Rule RuleId="1" Effect="Permit"/>
</Policy>
```

Save as **permit-apim-to-authenticated.xml**.

11. Restart Fedora by using the startup command from step 8:

```
$FEDORA_HOME/tomcat/bin/startup.sh
```

12. Access the Fedora Web Administrator: <http://localhost:8080/fedora/admin> and ensure you can ingest and purge objects.

13. For information on using Fedora, make use of the [tutorials](#) at the Fedora Commons site.

There are two global policies that block/override purge rights. This behaviour is correct as it assumes that items will be set to a status of "deleted" rather than being purged directly. By default it assumes that if an object or Datastream is set to active or inactive, then only the "administrator" role can purge. To resolve this, you can simply remove these policies in `$FEDORA_HOME/data/fedora-xacml-policies/repository-policies/default/`:

- deny-purge-datastream-if-active-or-inactive.xml
- deny-purge-object-if-active-or-inactive.xml
