fedora-purge

Permanently removes objects from the repository.

Usage:

```
fedora-purge [host:port]
             [user]
             [password]
             [pid]|[fileURI]
             [protocol]
             [log]
             [context]
```

Where:

- `host` - the hostname of the Fedora server; default is localhost
- `port` - the port number on which the Fedora server is running; default is 8080
- `user` - the Fedora user (e.g. fedoraAdmin)
- `password` - the Fedora user's password
- `pid|fileURI` - the PID of the object to permanently remove OR the URL for a file containing the PIDs of the objects to be purged, one PID per line
- `protocol` - the protocol to communicate with repository, either http or https
- `log` - an optional log message explaining the removal
- `context` - an *optional* parameter indicating the webapp context. This is only necessary if the Fedora server was installed under a context name other than 'fedora' (see Alternative Webapp Context Configuration).

Examples:

```
fedora-purge localhost 8080 fedoraAdmin fedoraAdmin demo:6 http "just because"
```

Purges the object whose pid is demo:6 from the target repository at localhost:8080 using the http protocol

```
fedora-purge localhost 8443 fedoraAdmin fedoraAdmin file:///some/dir/purge-pids.txt https "why not"
```

Purges all the objects whose pids are listed in the file /some/dir/purge-pids.txt from the target repository at localhost:8443 using the secure https protocol (SSL)
