

XML Form Elements

Overview

The XML Form Elements module defines custom elements to be used in conjunction with XML Forms and AHAH callbacks.

Elements

tabs/tabpanels

These Form Elements are used to model XML Nodes that can repeat and contain other XML Nodes.

Example:

```
<cntaddr> <!--tabpanel one -->  
  
<addrtype>undefined</addrtype>  
  
<city>undefined</city>  
  
<!-- ... -->  
  
</cntaddr>  
  
<cntaddr> <!--tabpanel two -->  
  
<addrtype>one</addrtype>  
  
<!-- ... -->  
  
</cntaddr>
```

tags/tag

These Form Elements are used to model XML Nodes that can repeat and contain only character data.

Example:

```
<origin>test</origin> <!-- tag #1 --> <origin>undefined</origin> <!-- tag #2 -->
<origin>testing</origin> <!-- tag #3 -->
```

Dependencies

Islandora.ca modules:

- Islandora XML Form API
- Islandora XML Schema API
- Objective Forms
- PHP Lib

Drupal.org modules:

- [jQuery Update](#)
- [jQuery UI](#)
