

Art Institute of Chicago Use Case - Structural Validation - Properties

Structural Validation - Properties

Title (Goal)	Support Fedora 3-style object classes (content models) - Structural Validation - Properties
Primary Actor	Repository architect & implementer
Scope	Data architecture and access
Level	High
Story (A paragraph or two describing what happens)	As a repository manager, 1. I can create "partial match" restrictions on content model properties

Example

1. Given the [myns:image](#) object, I want to make it able to have any number of metadata children. Children should be of type [myns:meta](#) or a subtype thereof, and their name should start with meta_ (e.g. meta_exif, meta_geo, etc.)

Limitations

1. There is no way, even in CND, to achieve this.
