

Installing Drupal

Pre-installation software checklist

Drupal requires the following to be set-up and running prior to beginning your installation:

- Apache web server.
- MySQL 5.0.15 or higher with PDO, PostgreSQL 8.3 or higher with PDO, SQLite 3.3.7 or higher
- PHP 5.2.5 or higher (5.3 recommended for use with Islandora) (<http://www.php.net/>).

Installation Steps

These are the quick “get-up-and-running” installation steps for Drupal, targeted at an audience comfortable using a command line interface. A more comprehensive installation guide is available from [Drupal.org](http://drupal.org).

cd to the location where you wish to install Drupal.

1. Obtain the latest [Drupal](http://drupal.org) release and extract the contents of the compressed file.

```
$ wget http://ftp.drupal.org/files/projects/drupal-x.x.tar.gz
$ tar -xzf drupal-x.x.tar.gz
```

This version of Islandora is currently only compatible with Drupal 7.x. Documentation for Islandora 6.x can be found [here](#).

2. Move the contents of the drupal-x.x directory into a directory within your web server's document root or public HTML directory (ensure that the .htaccess file, a hidden file, is successfully moved into the destination directory as well).

```
$ mv -v drupal-x.x public_html/your_drupal_directory
```

Please note: Your Apache config will need to so reflect the path to your Islandora install. Apache site/virtual host configuration files are ideal.

Please note: With Drupal 7.x, on some types of shared/local hosting, if PHP and Apache are run by the same user, Drupal will attempt to execute steps 3 and 4 on its own and you can skip directly to step 5. If you get errors referring to the "Settings file" during step 6 and beyond, you can perform steps 3 and 4 manually.

3. Make a copy of the default.settings.php file in the sites/default directory and name the copy settings.php.

```
$ cp sites/default/default.settings.php sites/default/settings.php
```

4. Give the web server **write** privileges to sites/default/settings.php and the sites/default /directory:

```
$ chmod a+w sites/default/settings.php
$ chmod a+w sites/default
```

5. Create a database for Drupal. Make note of your username and password as you will need it when the Drupal install script runs.

```
create database [drupaldatabase];
GRANT SELECT, INSERT, UPDATE, DELETE, CREATE, DROP, INDEX, ALTER, CREATE TEMPORARY
TABLES ON [drupaldatabase].* TO '[drupaldatabaseuser] '@'localhost' IDENTIFIED BY
'[password]';

flush privileges;
exit
```

6. Run the install script by pointing your browser to the base URL of your website (e.g. <http://www.example.com/>).

7. Work through the on-screen steps to complete the Drupal site installation.

8. When the install script succeeds, you will be directed to the "Welcome" page, and you will be logged in as the administrator.

9. Proceed with the initial configuration steps suggested on the "Welcome" page.

If you plan on uploading large files via Islandora you may want to increase the maximum file size settings in Drupal. You can do this by creating a custom INI file in /etc/php5.d/conf.d with the following settings:

```
upload_max_filesize = 2048M
post_max_size = 2048M
memory_limit = 256M
```

You must then restart Apache using one of the following commands:

```
/etc/init.d/apache reload
OR
/etc/init.d/httpd restart
```

For a good introduction to Drupal and to learn how to harness its power and potential to create a site that meets your needs, access Drupal's extensive [online documentation](#). Drupal's active [open source community](#) is another valuable source of information.
