

# Islandora Importer

## Overview

The Islandora Importer supports the import of a large number of objects simultaneously. It is intended primarily for ingesting objects described by MODS (and DC).

## Additional Modules Installed

- Zip File Importer (requires [Core Collection Solution Pack](#))

## Downloads

[Release Notes and Downloads](#)

## Usage

More information on how to use the Batch Importer module can be found in the section [How to Batch Ingest Files](#).

[XML Form Builder](#) forms are not used when batch ingesting via the ZIP importer. Importer looks for metadata XML files and runs XSLTs as required. The module currently supports metadata in MODS, MARCXML, and DC formats.

To batch import metadata records using other schemas (e.g. Darwin Core) you can do so using the [Islandora Batch](#) module, which will allow the creation of any datastreams you like. However, this module does not yet have a user interface within Islandora and must be accessed via Drush on the command line. Instructions are in the README.
