Audit Service Queries

1. Export all audit events occurred/captured in the repository

This query is expected to return all audit events recorded in a Fedora 4 repository. The query results may be filtered by:

- a specific date range, within which the events occurred,
- a certain type of events,
- a particular user associated with the events, or
- any combination of the above

Example: TBA

2. Export all audit events associated with a resource

This query is expected to return all audit events associated with a specific Fedora 4 resource. As with the query 1, the results of this query may also be filtered by:

- a specific date range, within which the events occurred,
- a certain type of events,
- a particular user associated with the events, or
- any combination of the above

Example: TBA

Additional queries/use cases (based on Unresolved Questions)

- Adding custom/external events
- Deleting custom/external events
