PHP Lib

PHP Lib is a collection (or 'library') of interfaces, classes and functions that are used by a variety of Islandora modules, most notably the Forms modules. It is used primarily to create pages that convert records in XML formats to a more human-readable version that is also able to be easily manipulated. This is done by a series of PHP files that Drupal includes when loading these pages.

Dependencies

PHP Lib has no dependencies, but also has no functionality as a standalone module.

Provisions

- XML Forms and its sub-modules
- Objective Forms

Downloads

PHP Lib is part of the Islandora Forms package, downloadable at the https://github.com/islandora/php_lib page.

Configuration

PHP Lib requires no configuration, and functions as soon as it is activated and installed as a Drupal module.
