

Executing streams of commands

You can pass a sequence of commands into the `dspace` command-line tool using the `read` command.

Execute commands...	this way
...from a file	<code>[dspace]/bin/dspace read a-command-file</code>
...in a pipeline	<code>some-other-command [dspace]/bin/dspace read -</code> <code>some-other-command [dspace]/bin/dspace read</code>

The command script (`a-command-file` in the example above) should contain one command per line, without the `'/bin/dspace'`. For example:

```
user --add --email john@example.com --password secret1
user --add --email marsha@example.com --password secret2
```
