Enhancing Freemarker templates with DataGetters

- Overview
- An example
- Creating the DataGetter
- Modifying the template
- Summary

Write SPARQL queries to add information to any Freemarker template.

Overview

Since VIVO 1.6, it is possible for a Freemarker template to display data that is not normally provided to it.

You can create an RDF file that describes a custom DataGetter object, and associates it with the desired template. Each time that template is used, the D ataGetter will be executed, and the data will be stored in a variable, so the template can display it.

This does not require changes to the Java code. You create the RDF file in your VIVO distribution directory and modify the template in your theme.

An example

Let's assume that we need to display information about the most recent data ingest operation. We want to display the name of the Person who supervised the ingest. We would like to display this on every page.

As part of the ingest process, we can load statements like this into the data model:

```
<http://vivo.mydomain.edu/individual/n5242>
<http://vivo.mydomain.edu/individual/isMostRecentUpdater>
"true" .
<http://vivo.mydomain.edu/individual/n5242>
<http://www.w3.org/2000/01/rdf-schema#label>
"Baker, Able" .
```

We would like for VIVO to display the name of this individual on every page, so the footer will change from this:

```
      ©2013 VIVO Project | Terms of Use | Powered by VIVO | Version unknown
      About
      Support

      to this:
      ©2013 VIVO Project | Terms of Use | Powered by VIVO | Version unknown | Updated by Baker, Able
      About
      Support
```

Creating the DataGetter

VIVO allows you to define and use DataGetter objects in several contexts. DataGetters come in many flavors, but the most commonly used is the Spa rqlQueryDataGetter, which lets you define a SPARQL query, and store the results of that query for your Freemarker template to display.

By adding statements to your data model, you can define a SparqlQueryDataGetter object, and associate it with a Freemarker template. Here is the definition that is used in this example:

```
@prefix display: <http://vitro.mannlib.cornell.edu/ontologies/display/1.1#> .
@prefix rdf: <http://www.w3.org/1999/02/22-rdf-syntax-ns#> .
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#> .
<freemarker:footer.ftl> display:hasDataGetter display:updatedInfoDataGetter .
display:updatedInfoDataGetter
   a <java:edu.cornell.mannlib.vitro.webapp.utils.dataGetter.SparqlQueryDataGetter> ;
   display:saveToVar "updatedInfo" ;
   display:query """
   PREFIX rdfs: <http://www.w3.org/2000/01/rdf-schema#>
   PREFIX local: <http://vivo.mydomain.edu/individual/>
   SELECT (str(?rawLabel) AS ?updater)
   WHERE {
       ?uri local:isMostRecentUpdater ?o ;
            rdfs:label ?rawLabel .
   }
   LIMIT 1
     """.
```

These statements can be added to your data model in any of several ways. For this example, I stored these lines in a file called data_getter_for_exam ple.n3 and placed it in the VIVO distribution directory under rdf/display/everytime. Files placed in this directory are loaded when VIVO starts, but are not persisted when VIVO stops. This allows you to edit or remove the file without leaving residual statements in your data model.

Notice that:

- The first statement says that the Freemarker template footer.ftl has a DataGetter, defined in subsequent lines.
- The definition of the DataGetter states:
 - the type of the data getter,
 - the SPARQL query that will be executed
 - ° the Freemarker variable that will hold the results.

The results of the SPARQL query are stored in a Freemarker variable, in this case updatedInfo. The variable will contain a Sequence of Hashes, where each Hash represents one line of the SPARQL result. Within each Hash, result values are specified as key/value pairs.

For more information on Sequences and Hashes, consult the Freemarker manual:

- Retrieving data from a Sequence
- Retrieving data from a Hash

Modifying the template

Here is the standard footer.ftl template, as used in VIVO 1.6:

```
<#-- $This file is distributed under the terms of the license in /doc/license.txt$ -->
1
2
3
   </div> <!-- #wrapper-content -->
4
5
   <footer role="contentinfo">
6
       7
          <#if copyright??>
8
              <small>&copy;${copyright.year?c}
9
              <#if copyright.url??>
10
                  <a href="${copyright.url}" title="copyright">${copyright.text}</a>
11
              <#else>
12
                  ${copyright.text}
13
              </#if>
14
               | <a class="terms" href="${urls.termsOfUse}" title="terms of use">Terms of Use</a></small> |
15
          </#if>
          Powered by <a class="powered-by-vivo" href="http://vivoweb.org" target="_blank" title="powered by VIV0"><strong>VIV0</strong></a>
16
17
           <#if user.hasRevisionInfoAccess>
18
               | Version <a href="${version.moreInfoUrl}" title="version">${version.label}</a>
19
           </#if>
20
       21
22
       <nav role="navigation">
          23
24
              role="listitem"><a href="${urls.about}" title="about">About</a>
25
              <#if urls.contact??>
                  <a href="${urls.contact}" title="contact us">Contact Us</a>
26
27
              </#if>
              <a href="http://www.vivoweb.org/support" target="blank" title="support">Support</a>
28
29
          30
       </nav>
31
   </footer>
32
   <#include "scripts.ftl">
33
```

Insert these lines between lines 19 and 20:

```
<#if (updatedInfo?first.updater)??>
    | Updated by ${updatedInfo?first.updater}
</#if>
```

The SPARQL result is obtained and stored into the Freemarker variable updatedInfo each time the footer.ftl template is loaded for display. The name we want is in the first row of the SPARQL result, keyed to the name updater.

Summary

Enhancing Freemarker templates is one more way to use the VIVO DataGetter mechanism. When you associate a DataGetter with a Freemarker template, that DataGetter will be run each time the template is invoked. This is true whether the template is specified by the controller, or included in another template. You can modify the template to display the data from the DataGetter, but it is prudent to include an <#if> tag, so your template won't fail if the data is not found.
