

Semantic Web resources

The VIVO project implements a number on W3C Semantic Web technology standards including RDF, OWL and SPARQL.

Please note the distinction between ***Semantic Web technologies***, and ***Semantic Technologies***, as described in this [Cambridge Semantics article](#). It is also possible that the domain of Semantic Technologies, such as Natural-language processing (NLP) and data mining, will be of interest to VIVO developers and implementation teams. This domain addresses technical challenges faced by Semantic Web implementations attempting to integrate large amounts of information from existing, data sources that aren't already Linked Data.
