Structure - Check Bitstream names against allowed file name pattern

Title (Goal)	Check Bitstream names against allowed file name pattern
Primary Actor	End User | Administrator
Scope	
Level	
Story (A paragraph or two describing what happens)	This is a similar to Structure - Format checking of data entry in input forms. I frequently get a the request to change the name of a bitstream, eg remove space, fix spelling, ... Users who want to change a bitstream's name during the upload step, must rename the file on their local computer and upload a second time. One reason for this is that the bitstream name is automatically assigned on the basis of the uploaded file's name. At a minimum users should get the option to change the suggested bitstream name. In addition - with a regexp configuration option - users could be reminded of the institutions naming standard.
