

Granular review workflow for new versions

Title (Goal)	Granular review workflow for new versions
Primary Actor	Administrator
Scope	Workflow / Versioning
Level	
Story (A paragraph or two describing what happens)	When a new version of an item is created, this currently creates a new workflow task. However, the only choices (as for all workflow tasks) are to accept the new version in its entirety or to reject the new version. It would be useful to have a more granular review workflow for updates to a live item; sometimes a new version may not be needed, or the ideal state would be a merge between the current live item and the new version (in terms of bitstreams and metadata).
