

Dependencies

Dependencies are Drupal modules or server-side applications that other modules and applications depend on to function. Dependencies are required before installing related modules. Each section of the documentation describing a module describes its dependencies. If you find that there is an undocumented dependency, please let us know via [any community channel](#) so that we can update this documentation.

Dependencies in this section may themselves have additional dependencies that require installation. We cannot provide instructions on how to install every sub-dependency required by dependencies here; links are provided, however, to sub-dependencies' websites for further instruction.

For many dependencies, a list of **provisions** are given - in this context, a provision will refer to any module or application for which the dependency provides functionality.
