

# SI - Return an emulation of the data and behavior of an object or graph of objects

Title (Goal)	As a data user, I want a representation returned that emulation of the data and behavior of an object or graph of objects
Primary Actor	Data user
Scope	
Level	
Author	<a href="#">Daniel Davis</a>
Story (A paragraph or two describing what happens)	Data is not a static thing but often requires capturing behavior to provide an authentic experience.

As a data user, I want to want both the data and its behavior. Currently we expect the consumer to provide the behavior but this often inadequate to get an authentic experience. I should be able to emulate the behavior in the context of the data. While this is potentially an advanced subject, simple things are possible such as providing a viewer with the data. Or providing an application. Research can often be captured by a workflow system.

- When working with a spreadsheet I want to have working formulas
- A workflow system can be presented as a service via an API that can be used to repeatedly execute a set of research activities from a model tied to the research's context
- A service could be deployed that emulates an API tied to the behavior and data
