

Islandora Usage Stats

Overview

A module for Drupal 7 to track views and downloads of Islandora items. Features include:

- Toggle to ignore common bots
- View count uses session variables and defaults to a 5 minute cooldown for repeated requests
- Access log for all views and downloads
- IP Exclusion list to prevent artificially inflating counts while testing/developing/administrating
- Several customizable blocks to display metrics
- Report generating interface
- Object log views integration

Does **not** respect XACML or namespace restrictions.

This is a server-side tracking solution, as such a caching layer could impact it. If this is impacting you, a [solution](#) using JavaScript may work better.

Dependencies

- [Tuque](#)
- [Islandora](#)
- [Islandora basic collection](#)
- [Views \(3.x\)](#)
- [Date](#)
- [Datepicker](#)
- [Views Data Expo](#)

Configuration

Configuration options are available at http://path.to.your.site/admin/islandora/tools/islandora_usage_stats.

Islandora Usage Stats Settings

[Home](#) » [Administration](#) » [Islandora](#) » [Islandora Utility Modules](#)

OMIT IPS

Add IP addresses that you want to omit from usage tracking

localhost 127.0.0.1

Add IPs separated by spaces

Cooldown time

300

The number of seconds to wait before counting a repeated view request from the same IP

☒ Exclude bots

Exclude common bots to avoid artifical view count inflation.

CLEAR VALUES

ACCESS LOG

Clear object views access log

Clear datastream download log

OBJECT VIEWS

PID
