

# 2015 Duraspace Summit Planning

## Fedora Candidate Topics

1. Sustainability
  - a. Resourcing - we need a continuous participation in the project concerning development plan to target how to get more developers, and an analysis of what it will take to convince ULs/high-level managers to free up resources on a rotating basis (i.e. some level of continuous participation in the project).
  - b. Positioning Fedora for the future - moving toward adopting existing standards and technologies. Focus on APIs and integrations rather than custom code. Moving to common object models to facilitate migrations and options at the interface layer.
2. Pilot/Test implementations
3. What do you need your digital repository to do in the next three years that you didn't need 3 years ago? I.e., what are the emerging needs and use cases that we should have in mind as we look at 4.x development?
