

# milestone 4 - Installing The "Tuque" library

## On This Page

- [Pre-Installation Software Checklist](#)
- [About the "Tuque" library](#)
- [Installing the Tuque library](#)
- [Testing the Tuque installation](#)
- [Advanced Tuque Topics](#)

## Pre-Installation Software Checklist

You must have the following installed **before** you install the Tuque library:

- [Fedora Respository Software](#)
- [Drupal Web CMS System](#)

## About the "Tuque" library

The Tuque library is a bundle of code that acts as the conduit between Islandora and Fedora Commons. In order for Islandora to properly communicate with Fedora Commons, you must have the Tuque library installed. For more information on the Tuque library, please see the documentation on github [<https://github.com/islandora/tuque>].

## Installing the Tuque library

### NOTE

You must have:

- Fedora Commons installed and properly configured in order to properly test Tuque
- Drupal installed and properly configured in order to install Tuque.

To install the Tuque library, run the following on your command line where Drupal is installed:

```
# mkdir -p /var/www/drupal/sites/all /var/www/drupal/sites/all/libraries
# cd /var/www/drupal/sites/all/libraries
# wget https://github.com/Islandora/tuque/archive/1.6.zip
# unzip 1.6.zip
# mv tuque-1.6 tuque
```

## Testing the Tuque installation

- Tuque installation is simple enough that it does not require a stand alone test. You will know it's working as you test the Islandora Core Module installation on [milestone 5](#). The test is the green check mark in /admin/islandora/configure. It is as simple as that.

## Advanced Tuque Topics

For advanced usage of Tuque you can consult the [All About Tuque](#) Appendix.
