Minutes

Update from OR

- [Aaron Birkland](#) won in the ideas challenge with an idea relating to API-X
- [David Wilcox](#) was happy to see movement in the community towards the Linked Data and other key Fedora components

Closed Tickets

- thanks [Bethany Seeger](#) for taking care of the mime type ticket, are the other related tickets resolved?
 - 2262 and 2516 should be resolved by the fix; 2420 which might have been resolved earlier
 - [Andrew Woods](#) will verify that these are indeed resolved

4.7.4 Release Planning

- Thanks [Danny Bernstein](#) for creating release candidate branch
- [Andrew Woods](#) would like to walk through cherry-picked commits and tickets to be clear on which tickets will be included
- The 4.7.4 release should be good to go (for testing to begin)
 - will need a release testing page
 - a release candidate
 - hope to get a message out next week to kick off testing

Deprecating RBACL and XACML modules

- given no champion has come forward for those modules, they should be marked as deprecated in 4.7.4 so that in the next major release they may cease to exist
- [Andrew Woods](#) will create a ticket and it must be completed before 4.7.4 release candidate

Import/Export release

- 2459 import or versions might not get done, can we make it not a blocker?
- 2518 is ready for review
- [Michael Durbin](#) will follow up about the status of 2459
- verification tool is close and should work
 - get import/export released ASAP
 - make sure verification tool still works against released code, then release it
 - ask for feedback on both

Fedora alignment to API sprint planning

- first final draft of the fedora spec was released
- forthcoming announcement about a sprint on Sept 11-22
 - generously coordinated and run by Johns Hopkins and [Aaron Birkland](#)
 - will require time beforehand to define tickets, priorities, etc.
- time allocated following that for a second sprint
- Los Alamos Memento folks are interested and might even provide resources to the versioning part of this effort

OAuth for Fedora?

- motivated by work with CoS OSF at Johns Hopkins
- developing a "fedora provider" to allow content to be read and written into Fedora by OSF
- [Daniel Lamb](#) asked to clarify that fedora would consume OAuth tokens from big name sources like google and such
 - yes, basic auth is terrible authenticating through a well-used authentication provider using OAuth would make things cleaner and easier
- want to look at what Claw is doing (beyond basic auth)

- Claw uses a Valve in tomcat (container-based, outside of fedora)
 - APIX wasn't an option then, but might make more sense for folks using alternate deployment (or implementation) of Fedora
- want to "put fedora on the internet" (a sadly unusual case these days)
- in the early stages, much investigation remains
