

Islandora PREMIS

Introduction

This module produces XML and HTML representations of [PREMIS](#) metadata for objects in your repository. Currently, it documents all fixity checks performed on datastreams, includes 'agent' entries for your institution and for the Fedora Commons software and, maps contents of each object's "rights" elements in DC datastreams to equivalent PREMIS "rightsExtension" elements.

PREMIS XML describing all the datastreams in an object [looks like this](#).

Requirements

This module requires the following modules/libraries:

- [Islandora](#)
- [Tuque](#)

Recommended modules:

- [Islandora Checksum](#): create checksums.
- [Islandora Checksum Checker](#): periodically verifies checksums on datastreams and will populate your Islandora objects' audit logs with fixity checking 'events' that map to PREMIS.

Downloads
