

1) Statistics available at all levels of hierarchy, including the whole repository

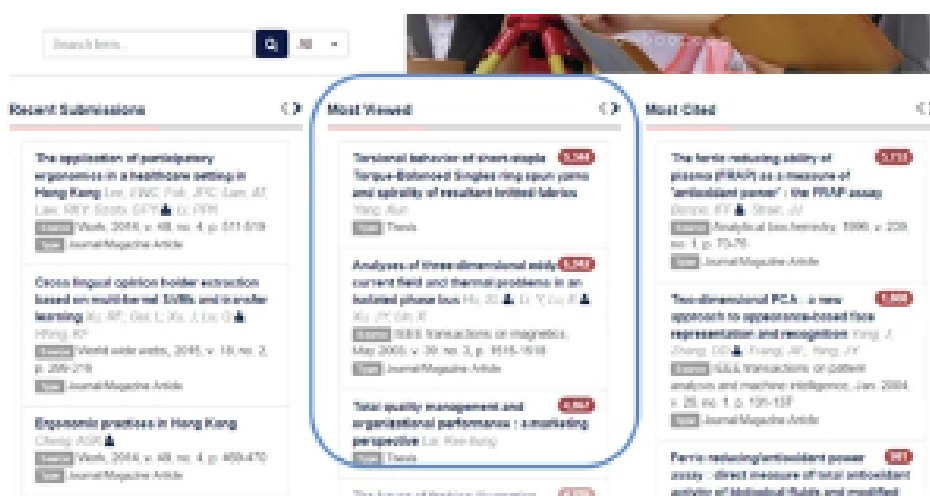

For example who's viewing and downloading it:

2) Global & Top item views & downloads

Information about views and downloads automatically feed the dynamic components in the system, so to always have up to date information:

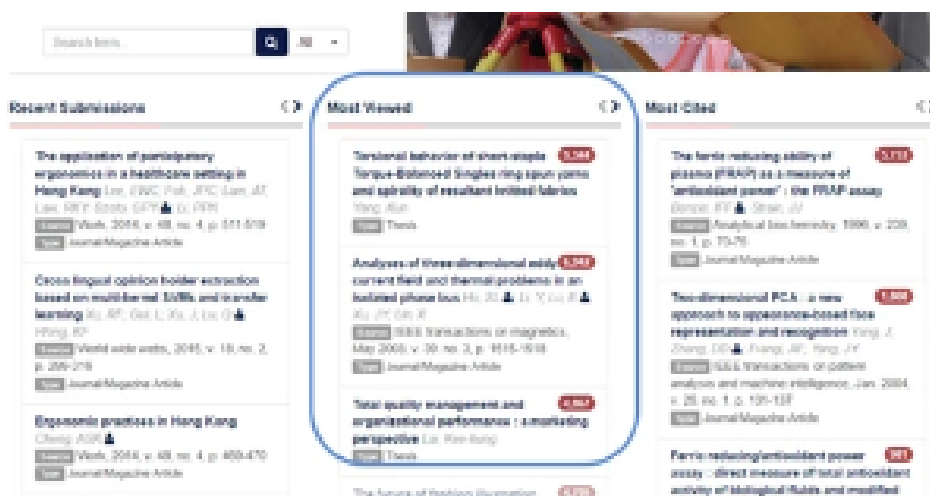

3) Statistics about each single entity

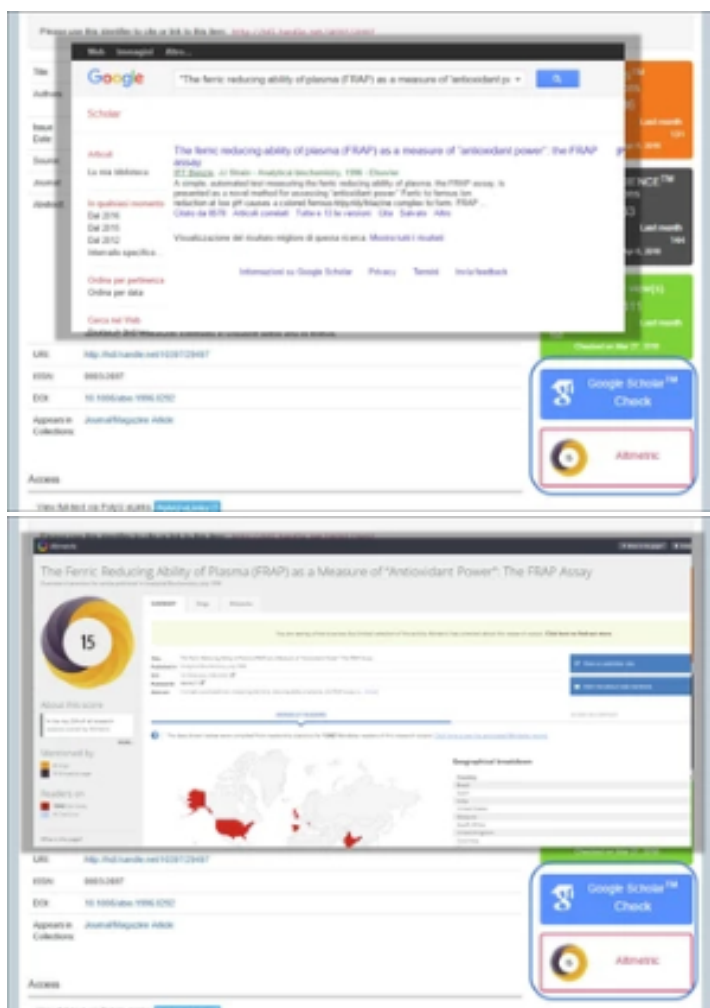

The statistics available at the general level, work for each single entity as well, allowing very detailed analysis.

- Cited-by count in the item page

One example is the number of citations for each publication, coming from different external databases:

The systems has direct links to both Google Scholar and Altmetrics:

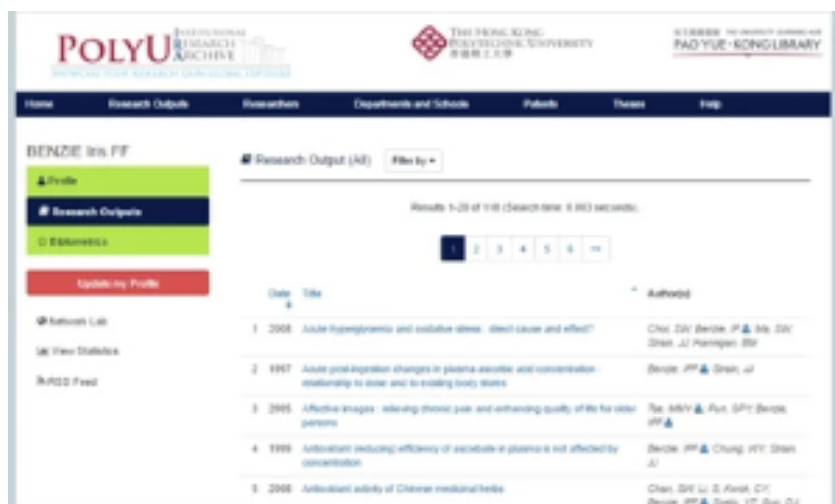

- Items' views and downloads by regions

Or the views and downloads, based on types or regions or any other filter you need to apply:

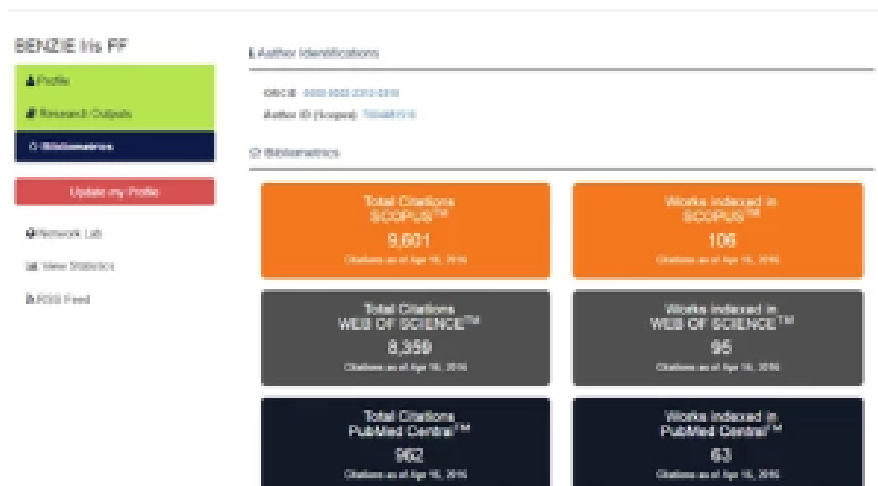

4) Aggregated statistics of linked items

All the objects (publications, projects, etc.) linked to a researcher can be automatically included in her profile thanks to the DSpace-CRIS dynamic components:

And that works for the metrics too:

5) Automatic periodical alerts

Periodical alert can be configured to be automatically sent via email or RSS. For example when a publication is downloaded/viewed, or a new project starts, etc.
